A REAL OPEN-SOURCE ISSUE

“hey this is broken”

`screenshot.png` …and nothing else

No stack trace. No file name. No line number.

400

files in the repo

A first-time contributor has nowhere to start.

That gap — between *I want to help* and *I know which file to open* — is where they quit.

Every screenshot-only issue is a door closed to everyone who doesn't already know the code.

SNAPLOCATE

It reads the screenshot and tells you where to look.

The files
ranked, each with its evidence

The call path
how they reach each other

S / M / L
what you’re taking on

Blast radius
what a fix could break

Two open pieces, doing the work

GEMMA 4 · OPEN WEIGHTS

Reads the pixels

Every on-screen string, copied **verbatim** — typos and all. Correct the typo and it matches nothing.

`“Coudn’t complete yor order”`

GRAPHIFY · CODE GRAPH

Walks the calls

It surfaces a file containing **none** of the screenshot’s text — reachable only through the call graph.

`6,486 edges · 1,518 calls`

That is the difference between *where does this text live* and *where does this bug live*.

Built, running, and checkable

116
checks passing, no network, no key

0
runtime dependencies — stdlib only

375/375
files resolved into the code graph

7/1000
box error vs measured ground truth

snaplocate.vercel.app — live, no sign-up, no key
